## Bonus Content: DMS and Type Checking Puzzle

### **Online Video Only**

Lecture 10, CS61B, Spring 2024

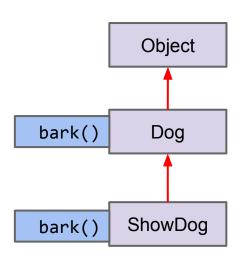

### A Typing Puzzle

### Suppose we have two classes:

- Dog: Implements bark() method.
- ShowDog: Extends Dog, overrides bark method.

### Summarizing is-a relationships, we have:

- Every ShowDog is-a Dog
- Every Dog is-an Object.
  - All types in Java are a subtype of Object.

### A Typing Puzzle

For each assignment, decide if it causes a compile error.

For each call to bark, decide whether: 1. Dog.bark() is called, 2. ShowDog.bark() is called, or 3. A syntax error results.

```
Object o2 = new ShowDog("Mortimer", "Corgi", 25, 512.2);
ShowDog sdx = ((ShowDog) o2);
sdx.bark();
Dog dx = ((Dog) o2);
dx.bark();
((Dog) o2).bark();
Object o3 = (Dog) o2;
```

o3.bark();

 $\Theta$ 

The rules:

- Compiler allows memory box to hold any subtype.
- Compiler allows calls based on static type.
  - Overridden non-static methods are selected at run time based on dynamic type.
    - **Everything else is based on static type**, including overloaded methods. Note: No overloaded methods for problem at left.

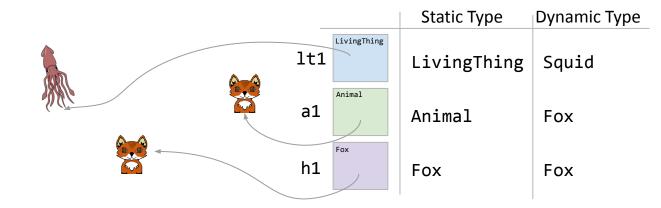

### Static Type vs. Dynamic Type

Every variable in Java has a "compile-time type", a.k.a. "static type".

This is the type specified at declaration. Never changes!

Variables also have a "run-time type", a.k.a. "dynamic type".

- This is the type specified at instantiation (e.g. when using new).
- Equal to the type of the object being pointed at.

### Static Methods, Variables, and Inheritance

You may find questions on old 61B exams, worksheets, etc. that consider:

- What if a subclass has variables with the same name as a superclass?
- What if subclass has a static method with the same signature as a superclass method?
  - For static methods, we do not use the term overriding for this.
- What if a subclass has methods that overload superclass methods?

These practices are generally not a good idea.

- It is bad style.
- There is almost no good reason to ever do this.
- The rules for resolving the conflict are a bit confusing to learn.
- I've pushed 61B away from learning these rules.
- But if you want to learn them, see
   <a href="https://docs.oracle.com/javase/tutorial/java/landl/override.html">https://docs.oracle.com/javase/tutorial/java/landl/override.html</a>

# Subtype Polymorphism vs. Explicit Higher Order Functions

Lecture 10, CS61B, Spring 2024

### **Subtype Polymorphism vs. Explicit Higher Order Functions**

Building a General Max Function

- The Naive Approach
- OurComparable
- Compilation Error Puzzle
- Comparable

Comparators

### Subtype Polymorphism

The biggest idea of the last couple of lectures: Subtype Polymorphism

Polymorphism: "providing a single interface to entities of different types"

a.k.a. compile-time type

Consider a variable deque of static type Deque:

- When you call deque.addFirst(), the actual behavior is based on the dynamic type. ----- a.k.a. run-time type
- Java automatically selects the right behavior using what is sometimes called "dynamic method selection".

Curious about alternatives to subtype polymorphism? See wiki or CS164.

### Subtype Polymorphism vs. Explicit Higher Order Functions

Suppose we want to write a program that prints a string representation of the larger of two objects.

```
Explicit
HoF
Approach
```

```
def print_larger(x, y, compare, stringify):
    if compare(x, y):
        return stringify(x)
    return stringify(y)
```

Subtype Polymorphism Approach

```
def print_larger(x, y):
    if x.largerThan(y):
        return x.str()
    return y.str()
```

Not to be confused with the fascinating Dr. Ernest Kaulbach, who taught my Old English class.

Sometimes called a "callback".

## The Naive Approach

Lecture 10, CS61B, Spring 2024

Subtype Polymorphism vs. Explicit Higher Order Functions

### **Building a General Max Function**

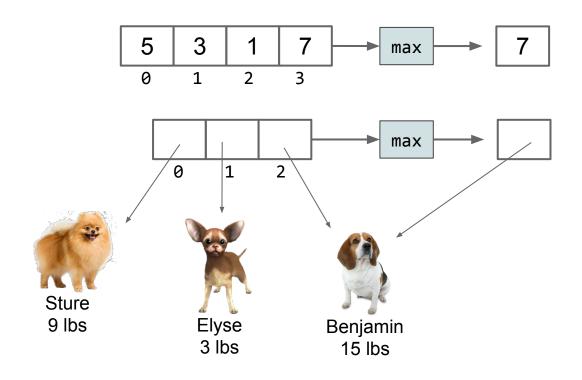

- The Naive Approach
- OurComparable
- Compilation Error Puzzle
- Comparable

Comparators

### Goal: The One True Max Function

Suppose we want to write a function max() that returns the max of any array, regardless of type.

### Compilation Error Challenge: yellkey.com/dog

Suppose we want to write a function max() that returns the max of any array, regardless of type. How many compilation errors are there in the code shown?

```
Maximizer.java
B. 1
             public static Object max(Object[] items) {
                int maxDex = 0;
                for (int i = 0; i < items.length; i += 1) {
                    if (items[i] > items[maxDex]) {
                        maxDex = i;
                return items[maxDex];
              DogLauncher.java
             public static void main(String[] args) {
                Dog[] dogs = {new Dog("Elyse", 3), new Dog("Sture", 9),
                              new Dog("Benjamin", 15)};
                Dog maxDog = (Dog) Maximizer.max(dogs);
                maxDog.bark();
```

### Writing a General Max Function

Objects cannot be compared to other objects with >

One (bad) way to fix this: Write a max method in the Dog class.

```
Maximizer.java
public static Object max(Object[] items) {
   int maxDex = 0;
  for (int i = 0; i < items.length; i += 1) {
       if (items[i] > items[maxDex]) {
           maxDex = i;
   return items[maxDex];
 DogLauncher.java
public static void main(String[] args) {
  Dog[] dogs = {new Dog("Elyse", 3), new Dog("Sture", 9),
                 new Dog("Benjamin", 15)};
   Dog maxDog = (Dog) Maximizer.max(dogs);
  maxDog.bark();
```

### Dog.maxDog

One approach to maximizing a Dog array: Leave it to the Dog class.

What is the disadvantage of this?

```
/** Returns maximum of dogs. */
public static Dog maxDog(Dog[] dogs) {
   if (dogs == null | dogs.length == 0) {
       return null; }
   Dog maxDog = dogs[0];
   for (Dog d : dogs) {
       if (d.size > maxDog.size) {
           maxDog = d;
   return maxDog;
                         Dog[] dogs = new Dog[]{d1, d2, d3};
                         Dog largest = Dog.maxDog(dogs);
```

### The Fundamental Problem

Objects cannot be compared to other objects with >

How could we fix our Maximizer class using inheritance / HoFs?

```
Maximizer.java
public static Object max(Object[] items) {
   int maxDex = 0;
   for (int i = 0; i < items.length; i += 1) {
       if (items[i] > items[maxDex]) {
           maxDex = i;
   return items[maxDex];
 DogLauncher.java
public static void main(String[] args) {
   Dog[] dogs = {new Dog("Elyse", 3), new Dog("Sture", 9),
                 new Dog("Benjamin", 15)};
   Dog maxDog = (Dog) Maximizer.max(dogs);
   maxDog.bark();
```

### OurComparable

Lecture 10, CS61B, Spring 2024

Subtype Polymorphism vs. Explicit Higher Order Functions

### **Building a General Max Function**

- The Naive Approach
- OurComparable
- Compilation Error Puzzle
- Comparable

Comparators

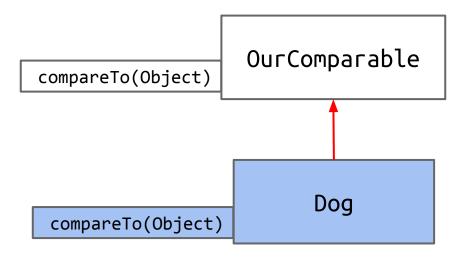

### **Solution**

Create an interface that guarantees a comparison method.

- Have Dog implement this interface.
- Write Maximizer class in terms of this interface.

Interface inheritance says **what** a class can do, in this case compare.

public static OurComparable max(OurComparable[] items) { ...

Maximizer.java

```
public class Maximizer {
   public static Object max(Object[] items) {
      int maxDex = 0;
     for (int i = 0; i < items.length; i += 1) {
         if (items[i] > items[maxDex]) {
            maxDex = i;
      return items[maxDex];
   public static void main(String[] args) {
     Dog[] dogs = {new Dog("Elyse", 3), new Dog("Sture", 9),
                    new Dog("Benjamin", 15)};
     Dog maxDog = (Dog) Maximizer.max(dogs);
     maxDog.bark();
```

This doesn't compile because you can't compare objects with the > operator.

```
OurComparable.java
public interface OurComparable {
```

```
public interface OurComparable {

public int compareTo(Object o);
}
```

### OurComparable.java

```
public interface OurComparable {
    /** Return -1 if this < o.
    * Return 0 if this equals o.
    * Return 1 if this > o.
    */
    public int compareTo(Object o);
}
```

```
Dog.java
```

```
public class Dog {
   private String name;
   private int size;
```

```
Dog.java
```

```
public class Dog implements OurComparable {
   private String name;
   private int size;
```

```
Dog.java
public class Dog implements OurComparable {
   private String name;
   private int size;
   public int compareTo(Object o) {
```

```
Dog.java
```

```
public class Dog implements OurComparable {
   private String name;
   private int size;

/** Returns -1 if this dog is less than the dog pointed at by o, and so forth. */
   public int compareTo(Object o) {
```

```
Dog.java
public class Dog implements OurComparable {
   private String name;
   private int size;
   /** Returns -1 if this dog is less than the dog pointed at by o, and so forth. */
   public int compareTo(Object o) {
       if (this.size < o.size) {</pre>
           return -1;
```

```
Dog.java
```

```
public class Dog implements OurComparable {
   private String name;
   private int size;
   /** Returns -1 if this dog is less than the dog pointed at by o, and so forth. */
   public int compareTo(Object o) {
       if (this.size < o.size) {</pre>
           return -1;
       } else if (this.size == o.size) {
           return 0;
```

```
Dog.java
```

```
public class Dog implements OurComparable {
   private String name;
   private int size;
   /** Returns -1 if this dog is less than the dog pointed at by o, and so forth. */
   public int compareTo(Object o) {
       if (this.size < o.size) {</pre>
           return -1;
       } else if (this.size == o.size) {
           return 0;
       return 1;
```

Dog.java public class Dog implements OurComparable { private String name; private int size; /\*\* Returns -1 if this dog is less than the dog pointed at by o, and so forth. \*/ public int compareTo(Object o) { Dog uddaDog = (Dog) o; if (this.size < uddaDog.size) {</pre> return -1; } else if (this.size == uddaDog.size) { return 0; return 1;

```
Maximizer.java
```

```
public class Maximizer {
   public static Object max(Object[] items) {
      int maxDex = 0;
      for (int i = 0; i < items.length; i += 1) {
         if (items[i] > items[maxDex]) {
            maxDex = i;
      return items[maxDex];
   public static void main(String[] args) {
      Dog[] dogs = {new Dog("Elyse", 3), new Dog("Sture", 9),
                    new Dog("Benjamin", 15)};
      Dog maxDog = (Dog) Maximizer.max(dogs);
      maxDog.bark();
```

```
Maximizer.java
```

```
public class Maximizer {
   public static OurComparable max(OurComparable[] items) {
      int maxDex = 0;
      for (int i = 0; i < items.length; i += 1) {
         if (items[i] > items[maxDex]) {
            maxDex = i;
      return items[maxDex];
   public static void main(String[] args) {
      Dog[] dogs = {new Dog("Elyse", 3), new Dog("Sture", 9),
                    new Dog("Benjamin", 15)};
      Dog maxDog = (Dog) Maximizer.max(dogs);
      maxDog.bark();
```

Maximizer.java

```
public class Maximizer {
   public static OurComparable max(OurComparable[] items) {
     int maxDex = 0;
     for (int i = 0; i < items.length; i += 1) {
         int cmp = items[i].compareTo(items[maxDex]);
         if (items[i] > items[maxDex]) {
            maxDex = i;
      return items[maxDex];
   public static void main(String[] args) {
     Dog[] dogs = {new Dog("Elyse", 3), new Dog("Sture", 9),
                    new Dog("Benjamin", 15)};
     Dog maxDog = (Dog) Maximizer.max(dogs);
     maxDog.bark();
```

Maximizer.java

```
public class Maximizer {
   public static OurComparable max(OurComparable[] items) {
     int maxDex = 0;
     for (int i = 0; i < items.length; i += 1) {
         int cmp = items[i].compareTo(items[maxDex]);
         if (cmp > 0) {
            maxDex = i;
      return items[maxDex];
   public static void main(String[] args) {
     Dog[] dogs = {new Dog("Elyse", 3), new Dog("Sture", 9),
                    new Dog("Benjamin", 15)};
     Dog maxDog = (Dog) Maximizer.max(dogs);
     maxDog.bark();
```

```
Dog.java
```

```
public class Dog implements OurComparable {
   private String name;
   private int size;
   /** Returns -1 if this dog is less than the dog pointed at by o, and so forth. */
   public int compareTo(Object o) {
       Dog uddaDog = (Dog) o;
       if (this.size < uddaDog.size) {</pre>
           return -1;
       } else if (this.size == uddaDog.size) {
           return 0;
       return 1;
```

This code is kind of long. We can simplify it with the following trick.

```
Dog.java
```

```
public class Dog implements OurComparable {
   private String name;
   private int size;
   /** Returns <0 if this dog is less than the dog pointed at by o, and so forth. */
   public int compareTo(Object o) {
      Dog uddaDog = (Dog) o;
       return this.size - uddaDog.size;
```

This code is kind of long. We can simplify it with the following trick.

```
OurComparable.java
```

```
public interface OurComparable {
    /** Return -1 if this < o.
    * Return 0 if this equals o.
    * Return 1 if this > o.
    */
    public int compareTo(Object o);
}
```

We need to modify our interface specification accordingly.

#### **Coding Demo: OurComparable**

```
OurComparable.java
```

```
public interface OurComparable {
    /** Return negative number if this < o.
    * Return 0 if this equals o.
    * Return positive number if this > o.
    */
    public int compareTo(Object o);
}
```

We need to modify our interface specification accordingly.

#### The OurComparable Interface

```
public interface OurComparable {
  int compareTo(Object o);
}
```

# Specification, returns:

- Negative number if this is less than obj.
- 0 if *this* is equal to object.
- Positive number if this is greater than obj.

Could have also been OurComparable. No meaningful difference.

the origin of uddaDog

```
public interface OurComparable {
   int compareTo(Object o);
public class Dog implements OurComparable {
   public int compareTo(Object obj) {
       /** Warning, cast can cause runtime error! */
      Dog uddaDog = (Dog) obj;
       return this.size - uddaDog.size;
public class Maximizer {
   public static OurComparable max(OurComparable[] a) {
```

 $Dog[] dogs = new Dog[]{d1, d2, d3};$ 

Dog largest = (Dog) Maximizer.max(dogs);

#### **General Maximization Function Through Inheritance**

# Benefits of this approach:

- No need for array maximization code in every custom type (i.e. no Dog.maxDog(Dog[]) function required).
- Code that operates on multiple types (mostly) gracefully, e.g.

```
OurComparable[] objs = getItems("somefile.txt");
return Maximizer.max(objs);
```

# **Compilation Error Puzzle**

    Maximizer.java
```

# Interfaces Quiz #2: yellkey.com/TODO

OurComparable.java

```
public class Dog
public class DogLauncher {
                                                implements OurComparable {
  public static void main(String[] args) {
                                                  public int compareTo(Object o) {
   Dog[] dogs = new Dog[]{d1, d2, d3};
                                                      Dog uddaDog = (Dog) o;
   System.out.println(Maximizer.max(dogs));
                                                      return this.size
                                                            uddaDog.size;
                                                public class Maximizer {
Q: If we omit implements OurComparable,
                                                  public static OurComparable max(
which file will fail to compile?
                                                         OurComparable[] items) {
                                                    int cmp = items[i].
    DogLauncher.java
                                                      compareTo(items[maxDex]);
    Dog.java
Β.
    Maximizer.java
```

#### **Answers to Quiz**

Problem 1: Dog will fail to compile because it does not implement all abstract methods required by OurComparable interface. (And I suppose DogLauncher will fail as well since Dog.class doesn't exist)

Problem 2: DogLauncher will fail, because it tries to pass things that are not OurComparables, and Maximizer expects OurComparables.

# Comparable

Lecture 10, CS61B, Spring 2024

Subtype Polymorphism vs. Explicit Higher Order Functions

# **Building a General Max Function**

- The Naive Approach
- OurComparable
- Compilation Error Puzzle
- Comparable

Comparators

#### The Issues With OurComparable

#### Two issues:

- Awkward casting to/from Objects.
- We made it up.
  - No existing classes implement OurComparable (e.g. String, etc).
  - No existing classes use OurComparable (e.g. no built-in max function that uses OurComparable)

Dog largest = (Dog) Maximizer.max(dogs);

```
public class Dog implements OurComparable {
   public int compareTo(Object obj) {
      /** Warning, cast can cause runtime error! */
      Dog uddaDog = (Dog) obj;
      return this.size - uddaDog.size;
   } ...
   Dog[] dogs = new Dog[]{d1, d2, d3};
```

#### The Issues With OurComparable

#### Two issues:

- Awkward casting to/from Objects.
- We made it up.
  - No existing classes implement OurComparable (e.g. String, etc).
  - No existing classes use OurComparable (e.g. no built-in max function that uses OurComparable)

The industrial strength approach: Use the built-in Comparable interface.

Already defined and used by tons of libraries. Uses generics.

```
public interface Comparable<T> {
   public int compareTo(T obj);
}
```

```
public interface OurComparable {
   public int compareTo(Object obj);
}
```

#### **Coding Demo: Comparable**

```
Dog.java
```

```
public class Dog implements OurComparable {
   private String name;
   private int size;

   /** Returns <0 if this dog is less than the dog pointed at by o, and so forth. */
   public int compareTo(Object o) {
        Dog uddaDog = (Dog) o;

        return this.size - uddaDog.size;
   }
}</pre>
```

```
public interface Comparable<T> {
    public int compareTo(T obj);
}
```

Replacing OurComparable with the built-in Comparable interface.

#### **Coding Demo: Comparable**

```
Dog.java
```

```
public class Dog implements Comparable<Dog> {
   private String name;
   private int size;

   /** Returns <0 if this dog is less than the dog pointed at by o, and so forth. */
   public int compareTo(Object o) {
        Dog uddaDog = (Dog) o;

        return this.size - uddaDog.size;
   }
}</pre>
```

```
public interface Comparable<T> {
    public int compareTo(T obj);
}
```

Replacing OurComparable with the built-in Comparable interface.

#### **Coding Demo: Comparable**

```
Dog.java
```

```
public class Dog implements Comparable<Dog> {
   private String name;
   private int size;

   /** Returns <0 if this dog is less than the dog pointed at by o, and so forth. */
   public int compareTo(Dog uddaDog) {

       return this.size - uddaDog.size;
   }
}</pre>
```

```
public interface Comparable<T> {
   public int compareTo(T obj);
}
```

Replacing OurComparable with the built-in Comparable interface.

#### **Coding Demo: OurComparable**

Maximizer.java

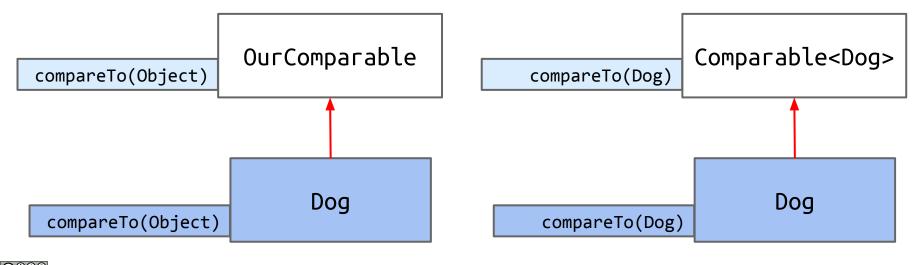

```
public class Maximizer {
   public static OurComparable max(OurComparable[] items) {
      int maxDex = 0;
      for (int i = 0; i < items.length; i += 1) {
         int cmp = items[i].compareTo(items[maxDex]);
         if (cmp > 0) {
            maxDex = i;
      return items[maxDex];
```

#### **Coding Demo: OurComparable**

Maximizer.java

```
public class Maximizer {
   public static Comparable max(Comparable[] items) {
      int maxDex = 0;
      for (int i = 0; i < items.length; i += 1) {
         int cmp = items[i].compareTo(items[maxDex]);
         if (cmp > 0) {
            maxDex = i;
      return items[maxDex];
```

# Comparable vs. OurComparable

#### **Comparable Advantages**

- Lots of built in classes implement Comparable (e.g. String).
- Lots of libraries use the Comparable interface (e.g. Arrays.sort)
- Avoids need for casts.

```
public class Dog implements Comparable<Dog> {
                                                                  Much better!
   public int compareTo(Dog uddaDog) {
       return this.size - uddaDog.size;
                                                            Implementing Comparable
public class Dog implements OurComparable {
                                                            allows library functions to
   public int compareTo(Object obj) {
                                                            compare custom types
       Dog uddaDog = (Dog) obj;
                                                            (e.g. finding max).
       return this.size - uddaDog.size;
             Dog[] dogs = new Dog[]{d1, d2, d3};
```

Dog largest = Collections.max(Arrays.asList(dogs));

# **Comparators**

Lecture 10, CS61B, Spring 2024

Subtype Polymorphism vs. Explicit Higher Order Functions

Building a General Max Function

- The Naive Approach
- OurComparable
- Compilation Error Puzzle
- Comparable

# **Comparators**

#### **Natural Order**

The term "Natural Order" is sometimes used to refer to the ordering implied by a Comparable's compareTo method.

 Example: Dog objects (as we've defined them) have a natural order given by their size.

"Doge", size: 5

"Grigometh", size: 200

"Clifford", size: 9000

#### **Natural Order**

May wish to order objects in a different way.

• Example: By Name.

"Doge", size: 5

"Grigometh", size: 200

#### Subtype Polymorphism vs. Explicit Higher Order Functions

Suppose we want to write a program that prints a string representation of the larger of two objects according to some specific comparison function.

```
def print_larger(x, y, compare, stringify):
    if compare(x, y):
        return stringify(x)
    return stringify(y)

def print_larger(x, y, compare, stringify):
    if compare(x, y):
        return stringify(y)
```

Subtype Polymorphism Approach??

```
def print_larger(T x, T y):
    if x.largerThan(y):
        return x.str()
    return y.str()
```

Can simply pass a different compare function.

#### Subtype Polymorphism vs. Explicit Higher Order Functions

Suppose we want to write a program that prints a string representation of the larger of two objects according to some specific comparison function.

```
Explicit
HoF
Approach
```

```
def print_larger(x, y, compare, stringify):
    if compare(x, y):
        return stringify(x)
    return stringify(y)
```

# Some possible designs (not the best):

- Add more functions compareTo2, compareTo3, compareTo4, etc.
- Add an extra argument to specify which comparison you want: public int compareTo(Dog uddaDog, String whichCompare)

Can simply pass a different compare function.

## Subtype Polymorphism vs. Explicit Higher Order Functions

Suppose we want to write a program that prints a string representation of the larger of two objects according to some specific comparison function.

```
def print_larger(x, y, compare, stringify):
    if compare(x, y):
        return stringify(x)
        return stringify(y)
```

Can simply pass a different compare

function.

Subtype Polymorphism Approach

```
def print_larger(T x, T y, comparator<T> c):
    if c.compare(x, y):
        return x.str()
    return y.str()
```

Dog.java

```
public class Dog implements Comparable<Dog> {
   private String name;
   private int size;

/** Returns <0 if this dog is less than the dog pointed at by o, and so forth. */
   public int compareTo(Dog uddaDog) {
      return this.size - uddaDog.size;
   }</pre>
```

Dog.java

```
public class Dog implements Comparable<Dog> {
   private String name;

   private int size;
   /** Returns <0 if this dog is less than the dog pointed at by o, and so forth. */
   public int compareTo(Dog uddaDog) {
       return this.size - uddaDog.size;
   public class NameComparator implements Comparator<Dog> {
       public int compare(Dog a, Dog b) {
           return a.name.compareTo(b.name);
```

#### Dog.java

```
import java.util.Comparator;
public class Dog implements Comparable<Dog> {
   private String name;
   private int size;
   /** Returns <0 if this dog is less than the dog pointed at by o, and so forth. */
   public int compareTo(Dog uddaDog) {
       return this.size - uddaDog.size;
   public static class NameComparator implements Comparator<Dog> {
       public int compare(Dog a, Dog b) {
           return a.name.compareTo(b.name);
```

```
public class DogLauncher {
   public static void main(String[] args) {
      Dog d1 = new Dog("Elyse", 3);
      Dog d2 = new Dog("Sture", 9);
      Dog d3 = new Dog("Benjamin", 15);
      Dog[] dogs = new Dog[]{d1, d2, d3};
```

```
DogLauncher.java
```

```
public class DogLauncher {
   public static void main(String[] args) {
      Dog d1 = new Dog("Elyse", 3);
      Dog d2 = new Dog("Sture", 9);
      Dog d3 = new Dog("Benjamin", 15);
      Dog[] dogs = new Dog[]{d1, d2, d3};
```

```
Dog.NameComparator nc = new Dog.NameComparator();
```

```
public class DogLauncher {
   public static void main(String[] args) {
      Dog d1 = new Dog("Elyse", 3);
      Dog d2 = new Dog("Sture", 9);
      Dog d3 = new Dog("Benjamin", 15);
      Dog[] dogs = new Dog[]{d1, d2, d3};
      Dog.NameComparator nc = new Dog.NameComparator();
       if (nc.compare(d1, d3) > 0) { // if d1 comes later than d3 in the alphabet
```

```
public class DogLauncher {
   public static void main(String[] args) {
       Dog d1 = new Dog("Elyse", 3);
       Dog d2 = new Dog("Sture", 9);
       Dog d3 = new Dog("Benjamin", 15);
       Dog[] dogs = new Dog[]{d1, d2, d3};
       Dog.NameComparator nc = new Dog.NameComparator();
       if (nc.compare(d1, d3) > 0) { // if d1 comes later than d3 in the alphabet
          d1.bark();
```

```
public class DogLauncher {
   public static void main(String[] args) {
       Dog d1 = new Dog("Elyse", 3);
       Dog d2 = new Dog("Sture", 9);
       Dog d3 = new Dog("Benjamin", 15);
       Dog[] dogs = new Dog[]{d1, d2, d3};
       Dog.NameComparator nc = new Dog.NameComparator();
       if (nc.compare(d1, d3) > 0) { // if d1 comes later than d3 in the alphabet
           d1.bark();
       } else {
           d3.bark();
```

#### Dog.java

```
import java.util.Comparator;
public class Dog implements Comparable<Dog> {
   private String name;
   private int size;
   /** Returns <0 if this dog is less than the dog pointed at by o, and so forth. */
   public int compareTo(Dog uddaDog) {
       return this.size - uddaDog.size;
   public static class NameComparator implements Comparator<Dog> {
       public int compare(Dog a, Dog b) {
           return a.name.compareTo(b.name);
```

#### Dog.java

```
import java.util.Comparator;
public class Dog implements Comparable<Dog> {
   private String name;
   private int size;
   /** Returns <0 if this dog is less than the dog pointed at by o, and so forth. */
   public int compareTo(Dog uddaDog) {
       return this.size - uddaDog.size;
   private static class NameComparator implements Comparator<Dog> {
       public int compare(Dog a, Dog b) {
           return a.name.compareTo(b.name);
```

```
Coding Demo: Comparator
    Dog.java
  import java.util.Comparator;
  public class Dog implements Comparable<Dog> {
      private String name;
      private int size;
      /** Returns <0 if this dog is less than the dog pointed at by o, and so forth. */
      public int compareTo(Dog uddaDog) {
         return this.size - uddaDog.size;
```

public int compare(Dog a, Dog b) {

return a.name.compareTo(b.name);

```
private static class NameComparator implements Comparator<Dog> {
public static Comparator<Dog> getNameComparator() {
```

```
Slight change to reflect Java convention.
 Dog.java
import java.util.Comparator;
public class Dog implements Comparable<Dog> {
   private String name;
   private int size;
   /** Returns <0 if this dog is less than the dog pointed at by o, and so forth. */
   public int compareTo(Dog uddaDog) {
       return this.size - uddaDog.size;
   private static class NameComparator implements Comparator<Dog> {
       public int compare(Dog a, Dog b) {
           return a.name.compareTo(b.name);
   public static Comparator<Dog> getNameComparator() {
       return new NameComparator();
```

DogLauncher.java

```
public class DogLauncher {
   public static void main(String[] args) {
       Dog d1 = new Dog("Elyse", 3);
       Dog d2 = new Dog("Sture", 9);
       Dog d3 = new Dog("Benjamin", 15);
       Dog[] dogs = new Dog[]{d1, d2, d3};
       Dog.NameComparator nc = new Dog.NameComparator();
       if (nc.compare(d1, d3) > 0) { // if d1 comes later than d3 in the alphabet
           d1.bark();
       } else {
           d3.bark();
```

#### DogLauncher.java

```
public class DogLauncher {
   public static void main(String[] args) {
       Dog d1 = new Dog("Elyse", 3);
       Dog d2 = new Dog("Sture", 9);
       Dog d3 = new Dog("Benjamin", 15);
       Dog[] dogs = new Dog[]{d1, d2, d3};
       Dog.NameComparator nc = Dog.getNameComparator();
       if (nc.compare(d1, d3) > 0) { // if d1 comes later than d3 in the alphabet
           d1.bark();
       } else {
           d3.bark();
```

#### DogLauncher.java

```
public class DogLauncher {
   public static void main(String[] args) {
       Dog d1 = new Dog("Elyse", 3);
       Dog d2 = new Dog("Sture", 9);
       Dog d3 = new Dog("Benjamin", 15);
       Dog[] dogs = new Dog[]{d1, d2, d3};
       Comparator<Dog> nc = Dog.getNameComparator();
       if (nc.compare(d1, d3) > 0) { // if d1 comes later than d3 in the alphabet
           d1.bark();
       } else {
           d3.bark();
```

```
DogLauncher.java
```

```
import java.util.Comparator;
public class DogLauncher {
   public static void main(String[] args) {
       Dog d1 = new Dog("Elyse", 3);
       Dog d2 = new Dog("Sture", 9);
       Dog d3 = new Dog("Benjamin", 15);
       Dog[] dogs = new Dog[]{d1, d2, d3};
       Comparator<Dog> nc = Dog.getNameComparator();
       if (nc.compare(d1, d3) > 0) { // if d1 comes later than d3 in the alphabet
           d1.bark();
       } else {
           d3.bark();
```

#### **Additional Orders in Java**

In some languages, we'd write two comparison functions and simply pass the one we want :

- sizeCompare()
- nameCompare()

The standard Java approach: Create SizeComparator and NameComparator classes that implement the Comparator interface.

Requires methods that also take Comparator arguments (see project 1C).

```
public interface Comparator<T> {
   int compare(T o1, T o2);
}
```

```
Dog not related by inheritance
                                                         to any of the classes below.
public interface Comparator<T> {
   int compare(T o1, T o2);
                                                                    Dog
                       compare(T, T)
                                     Comparator<T>
                                               compare(Dog,
      compare(Dog,
                  NameComparator
                                                            SizeComparator
             Dog)
                                                       Dog)
```

#### **Example: NameComparator**

```
public class Dog implements Comparable<Dog> {
  private String name;
  private int size;
  public static class NameComparator implements Comparator<Dog> {
      public int compare(Dog d1, Dog d2) {
          return d1.name.compareTo(d2.name);
           Comparator<Dog> cd = new Dog.NameComparator();
          if (cd.compare(d1, d3) > 0) {
               d1.bark();
             else {
                                     Result: If d1 has a name that comes
               d3.bark();
                                     later in the alphabet than d3, d1 barks.
```
